

The login and the sign up page has a radiant dark background with the required input text boxes and buttons. Also both the pages have buttons with gradient background which, on touching, change their background to grayish gradient. While filling details, if any input box is left blank, the boxes are reset and a temporary message appears on the screen to fill all the required details.

Logging in, there is a lustrous display of all the features this app comprises of i.e., a speaking calculator, a camera, a media cum video player, and two surprise elements – a quiz and a magical music player. Clicking on the icon of any of it directly redirects to the corresponding feature. One can sign off from the second page (though one will never wish so :P)

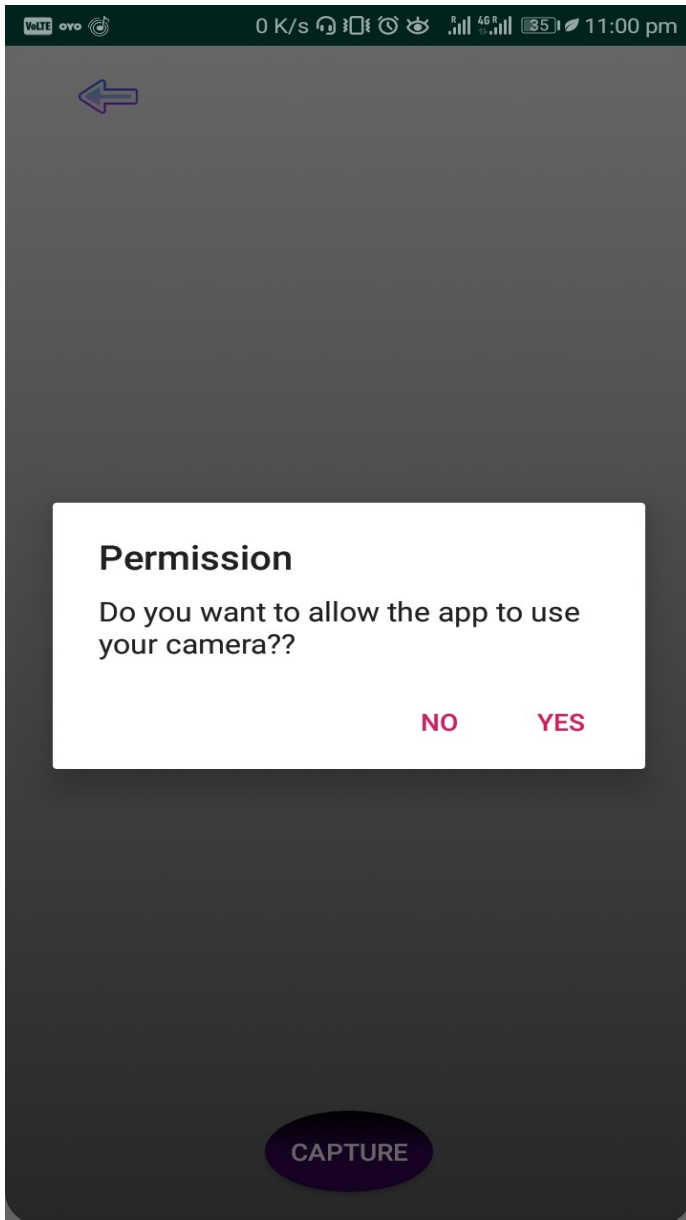

Now, this calculator has many features in it. There are two input text boxes, that take only numerical quantities as inputs (giving any other quantity as input resets the boxes to empty and displays a temporary error message). Choosing any option (+, -, x, /) displays it between the input text boxes. On touching the = option displays the result below it with it being verbally spoken by the text to speech element of surprise.

The media player app on starting, first confirms if the user is an adult. On confirmation, the video plays (only if the viewer is above 18, else the user is redirected to the previous page). Then the video plays with an additional feature of autochanging background continuously to add extra radiation. The app also auto-rotates on rotating the screen. One can start, stop and forward the video using the options displayed at the bottom of the screen.

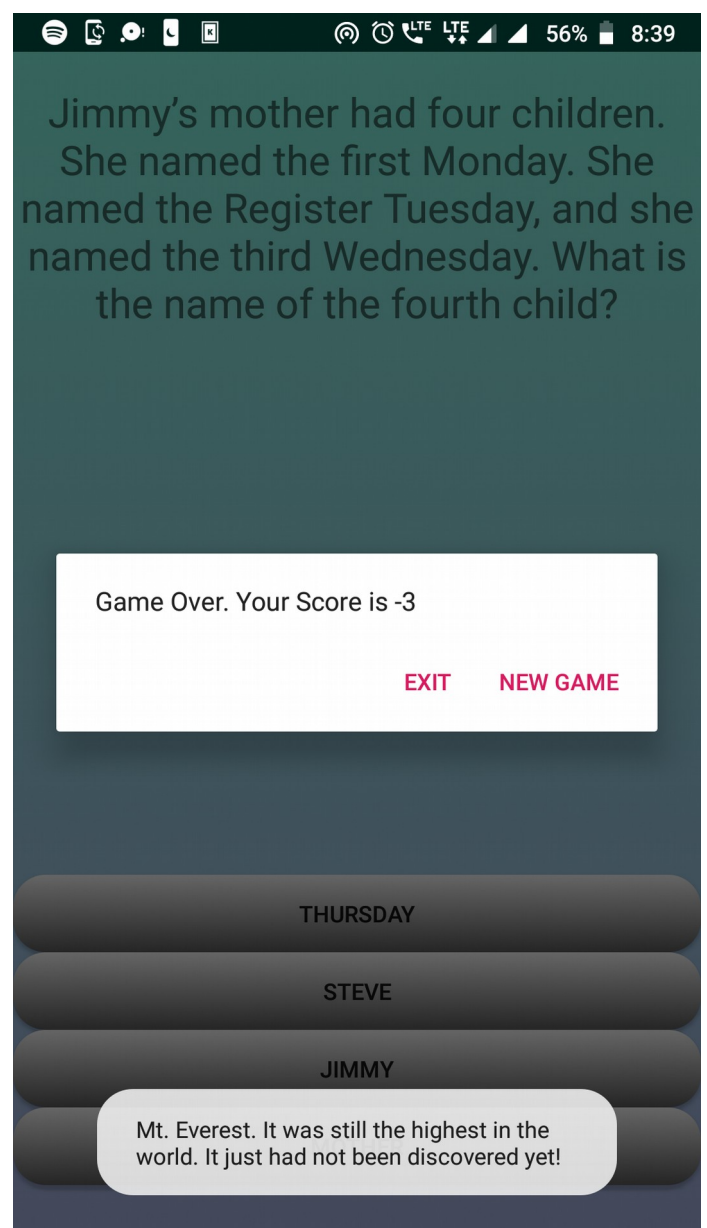

This camera app first asks the user the permission to use the camera and if allowed gives an option to capture the image right at the bottom centre of the screen. On clicking the option, the image is captured and the image is directly saved to the GALLERY (or PHOTOS) of the mobile. To go to the previous page, one can touch the back button at the top-left of the screen.

The magical music player is purely based on the light sensor of the device. Initially no music plays until the lustrous play button is chosen which activates the proximity sensor of the device and the same being displayed as a temporary message on the screen. Then the play-pause scenario takes place based on the light radiated on the device. The rest of the screen displays a witty image and a quote. Here again, a back button on the top left takes us to the previous page.

The quiz is an interesting feature of this app in the sense that it has a series of tricky questions. Each question has 4 options with only one correct answer. +1 is awarded for correct answer and -1 for incorrect answer. Choosing the correct option displays a “You are correct” message on the screen while an incorrect option results in the display of the correct option and its explanation. This quiz comprises of 5 different questions and the final score is displayed in a popup box ultimately. Every quiz has different questions (So, no question of cheating :P).
